PART 1: VISUAL PERCEPTION

Player Tracking: Translate pixel data into players and ball/puck location

- Self Camera Calibration and Map Building
- Player/Object Detection
- Player/Team Identification and Re-Identification
- State Estimation and Data Association

Player Tracking

Activity Detection

2D/3D Pose Data

PART 1: VISUAL PERCEPTION

Player Tracking: Translate pixel data into players and ball/puck location

- Self Camera Calibration and Map Building
- Player/Object Detection
- Player/Team Identification and Re-Identification
- State Estimation and Data Association

From Standard Broadcast Footage, We Create:

Tracking Data

Game Events, Player Actions

For every league with available video feed

Physical metrics

- Top speed
- Total distance
- Jog distance
- Jog count
- Low speed run distance
- Low speed run count
- High speed run distance
- High speed run count
- Sprint distance
- Sprint count

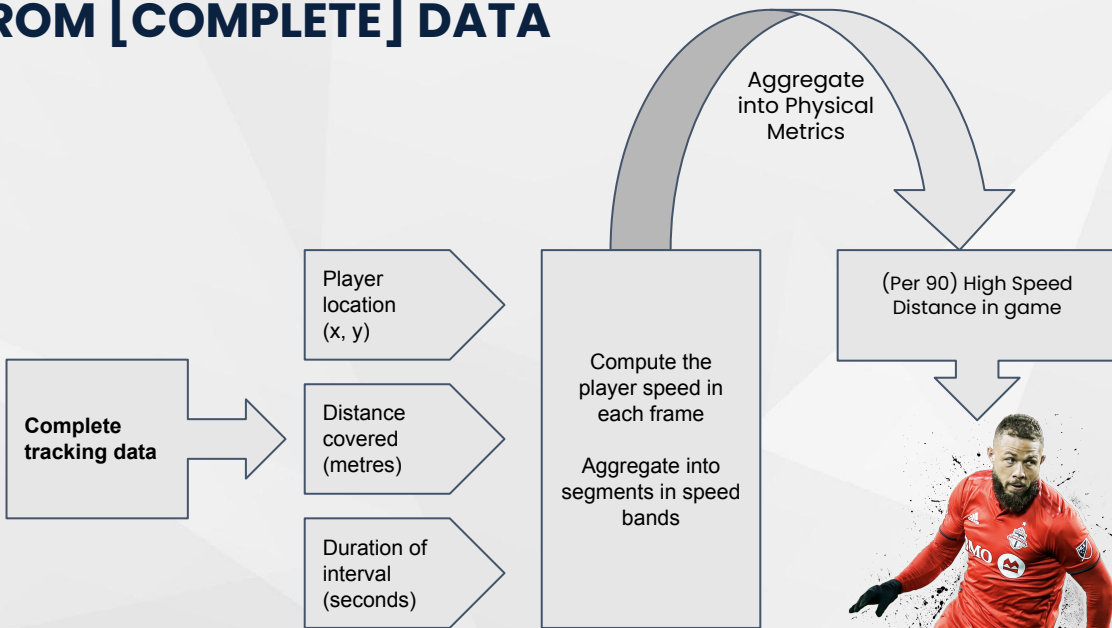

Contextual Data

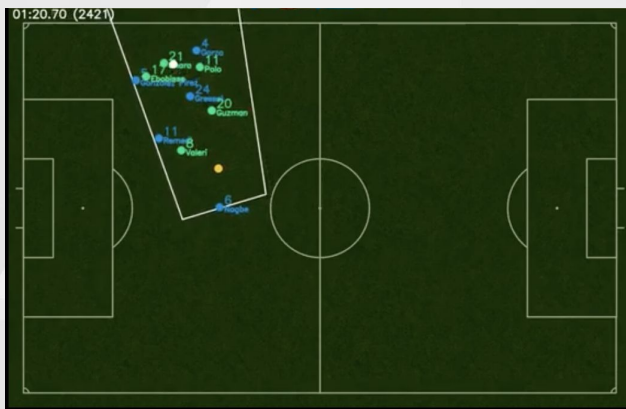

- Phases of play
- Defensive pressure intensity
- Clear passing options
- Clear line breaking options
- Players bypassed with pass/carry
- Line breaking carries
- Receiving context
- Shot clarity
- Passing lanes blocked
- Defensive lines held or broken
- Closest defender distance
- Shot lane blocks by defender

PHYSICAL METRICS FROM [COMPLETE] DATA

PHYSICAL METRICS FROM [INCOMPLETE] DATA

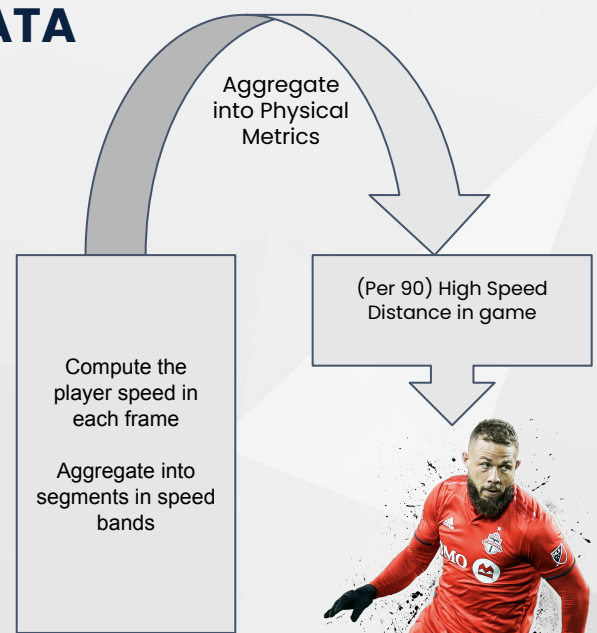

Need to estimate speed and distance covered for players when they are 'off-screen'

Broadcast tracking data

- Player location (x, y)
- Distance covered (metres)
- Duration of interval (seconds)

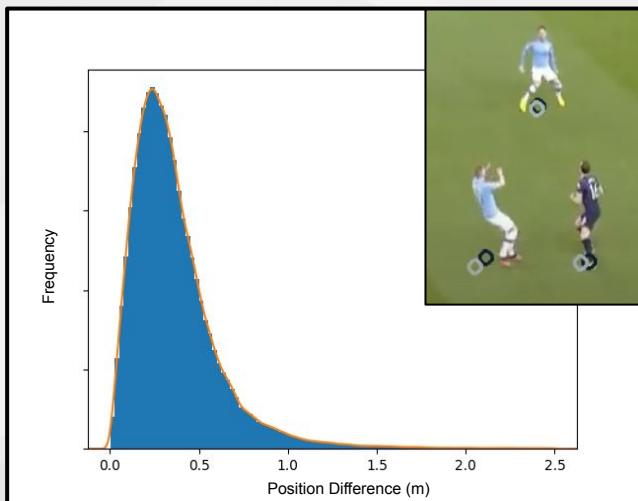

Players are not always in the camera's view
Player Tracks are 'noisy'

WHY IT IS DIFFICULT

Broadcast Data Is Noisy

Broadcast Data Is Incomplete

Broadcast Data Is Noisy

Broadcast Data Is Incomplete

The players are not always in the camera's view

We want to estimate off-camera player **locations** and **speeds**

There are some clues....

- ***In track:*** Use the most recent and next observations of the player to estimate the current location
- ***In frame:*** Use the relative locations of the on-camera players

Constraint: Formation Shall be Loosely Preserved

- Identify tactical actions during key phases
- Anchored to possession and spatial criteria
- Can occur on- or off-camera

iQ

- Possession
- Counter-attacks
- **Recovery runs**
- Overlapping runs
- Re-pressure (Genpres)

ADDING CONTEXT

- Identify tactical actions during key phases
- Anchored to possession and spatial criteria
- Can occur on- or off-camera

iQ

- Possession
- Counter-attacks
- Recovery runs
- **Overlapping runs**
- Re-pressure (Genpres)

Broadcast insights are quite powerful for teams and media because of the coverage, however

Data is imperfect

Data is incomplete

And generating insights is not easy

Thank you!
